

The Satellite Orbits ,Filing & Coordination

**By : Baydaa Ghazi Mahdi
MSc. Mobile & Satellite Communications
Chief Engineer
Ministry of Communications**

Introduction

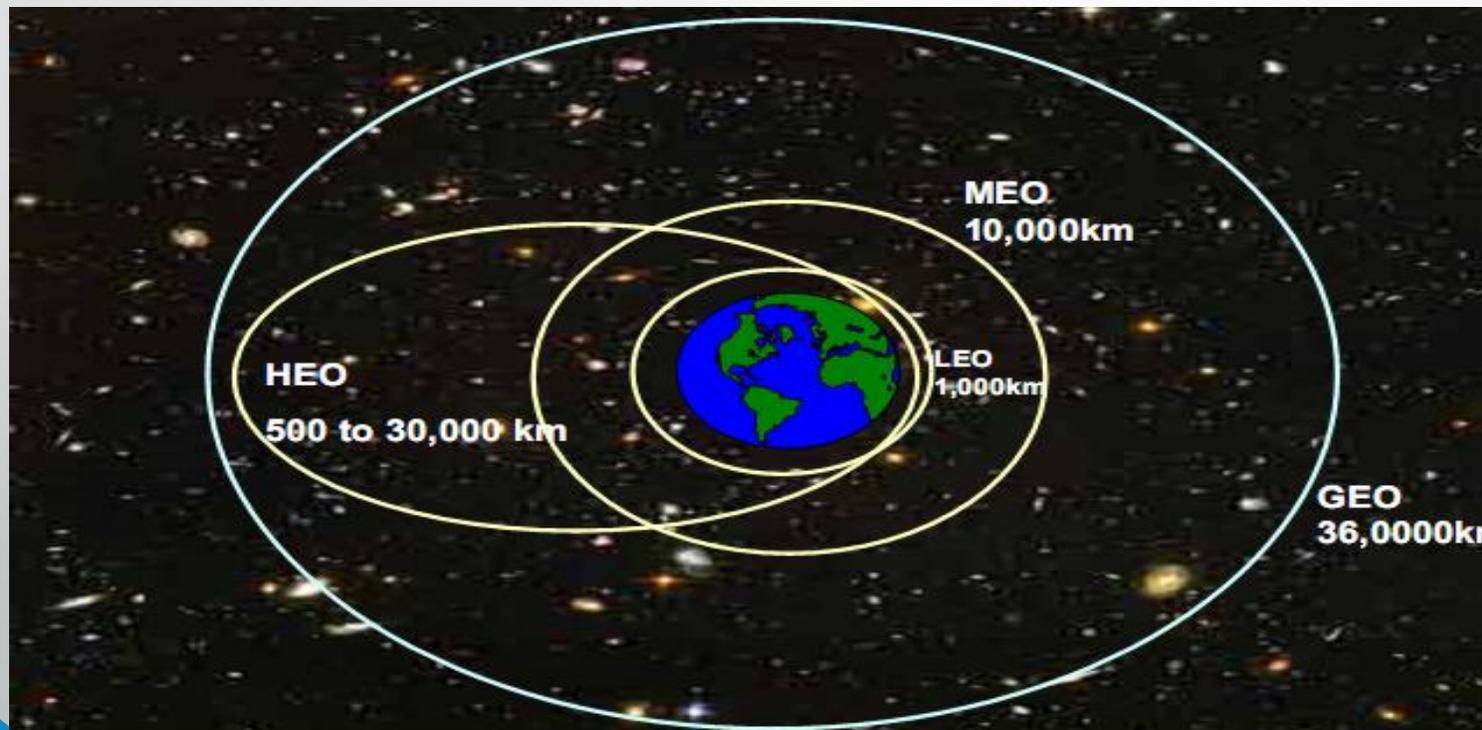

We'll discuss:

- Satellite Orbits , Services and Frequencies
- ITU Role and Procedures
- The Satellite Network Filing
- The Interference and Coordination

Satellite Orbits

✓ GSO: Geostationary Satellite Orbit

✓ NGSO: Non Geostationary Satellite Orbit

- LEO: Low Earth Orbit
- MEO: Medium Earth Orbit
- HEO: Highly Elliptical Orbit

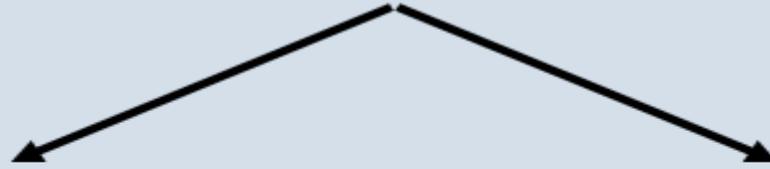

Some Satellite Frequency Bands

| Band | Frequency Range (Approx) | Major Services | Uses |
|------|--------------------------|----------------|---|
| L | 1 – 2 GHz | BSS, MSS, RNSS | <ul style="list-style-type: none">•INMARSAT/THURAYA mobile services•Digital Radio Broadcasting•GPS/GALLIEO Navigation |
| C | 4 – 6 GHz | FSS | Commercial trunk applications and some VSAT |
| X | 7 – 8 GHz | FSS, MSS | Military Communications |
| Ku | 10 – 14 GHz | FSS, BSS | Commercial DTH, VSAT services |
| Ka | 18 – 30 GHz | FSS, MSS | Military and Commercial |

ITU Role:

- ITU is the United Nations specialized agency for information and communication technologies
- Responsible to allocate global radio spectrum and satellite orbits
- Also responsible of International coordination, notification and recording procedures for space systems and earth stations

Two mechanisms of access to orbit / spectrum:

Coordination Approach

Efficient use

First come, first served for actual requirements

Planning Approach

Equitable access

Plan for future use

Coordination Procedure **“First Come, First Served”**

- Right is acquired through coordination with administrations concerned by actual usage
- **Efficient** spectrum / orbit management
- Also referred to as the ‘unplanned bands’
- Most widely used procedure for gaining access to the spectrum/orbit resource

Plan Procedure

- Guarantee for **equitable** access to the spectrum / orbital resources
 - Spectrum set aside for future use by all countries
 - Predetermined orbital position & frequency spectrum
- Plans exist for both BSS and FSS
- Generally less widely implemented than the unplanned bands.

Iraqi Satellite filings

- *Iraqi Files as Plans*

- BSS plan at 50°E
- FSS plan at 65.45°E

- *Iraqi Files as un planned*

- SUMER-1 network is at CR/C level (Valid until 13/02/2019)
- SUMER-2 network is at CR/C level (Valid until 13/02/2019)

Situation at 50°E

Position is unfavorable

- 48°E - Operations by EUTELSAT
- 48°E - Future operations by Ukraine
- 50°E - Operations by Intelsat
- 50°E - operations by Sri-Lanka
- 51°E - Operations by SES
- 52°E - operations by Turkmenistan Ministry of Communication (under filing from Monaco)
- 53°E - Operations by Yahsat

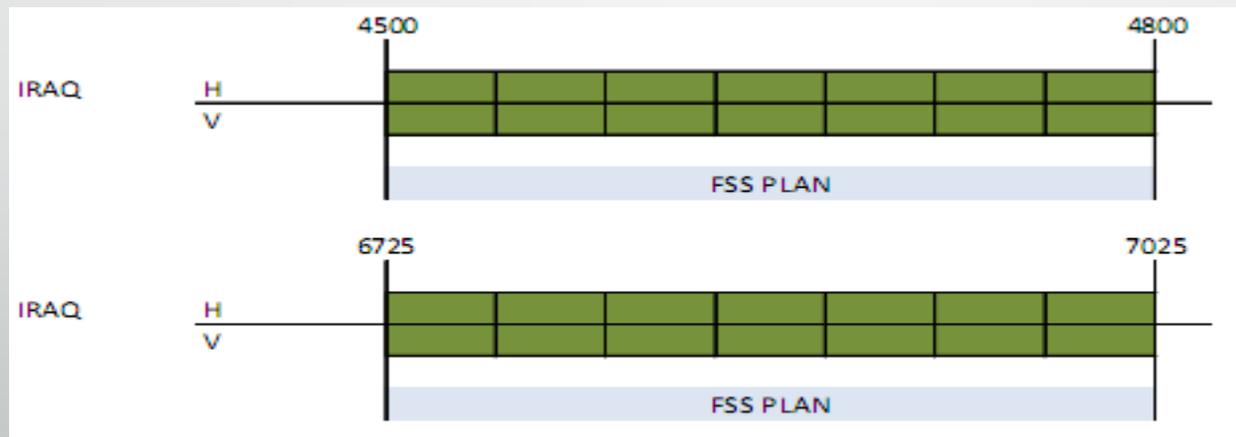

Situations at 65.45°E

Position is favorable

| FREQUENCY INFORMATION | | | | | | |
|-----------------------|-----------|--------------------|--------------------|------------------------|------------------------|--------------|
| BEAM NAME | EMISS/REC | FREQUENCY (MHZ) | BANDWIDTH (kHz) | FREQUENCY MIN (MHZ) | FREQUENCY MAX (MHZ) | CLASS OF STN |

my Master Dissertation

Interference and Coordination between Satellite and Terrestrial
Systems Operating at C-Band in Iraq

Distinction Grade

- 
- ❖ The frequency spectrum is a **limited** natural resources.
 - ❖ Usually a **multi** radio communication **services share** the same frequency
 - ❖ Sharing between the services should enable the **effective** and **efficient** operation of shared services
 - ❖ ITU had placed general **restrictions** on the emissions coming from satellite into terrestrial stations in term of **power flux density** of the satellite in specific reference bandwidth.

The Aim

The goal of this study is to **analysis the interference between satellite services and terrestrial in the C-band in Iraq**, with a focus on the **interference resulting from space services towards the terrestrial services** , the culmination of the project there will be a data base for satellites cover Iraqi territory in c-band with determining signal strength of these satellite and its impact on services in ground ,so to develop an interference map for Iraq quantifying the total interference signal power emanating from C-band into terrestrial antennas in microwave radio relay systems.

The Benefit

This study will be beneficial the Iraqi telecommunication sector in general in identifying interference analysis, also to have clear vision of the interference in C-band so that a correct plan of use can be put in place to the fixed terrestrial services in this band.

ITU Recourses to manage the interference from satellite services into terrestrial serveries

- **BR IFIC** for Space services: is an electronic document in DVD-ROM format, published by ITU- every two weeks contains contain many databases relating to satellite networks and earth stations recorded in the Master International Frequency Register (MIFR) of ITU

- **The Space Network Systems (SNS)** It is an online service produced by ITU which allows the user to review ITU database

A screenshot of the "Space Network Systems Online" website. The page has a white background with blue text. At the top, it says "Space Network Systems Online" and "Welcome to Space Network Systems Online!". Below that, it describes the SNS Online service and its access. A table of query systems is shown, with blue callout boxes pointing to specific entries. The callouts are: "Query for non-planned bands", "Query for planned bands", "API Query (Regulatory deadlines)", and "Resolution 49 Query (Due diligence filing)".

Space Network Systems Online

Welcome to Space Network Systems Online!

SNS Online gives access to the Space Networks Systems Database of the Radiocommunication Bureau of the ITU. The database contains AP4 data of more than 10500 geostationary satellite filings, 1070 non-geostationary satellite filings and 7900 earth station filings.

SNS Online is a yearly subscription service. It is available as a free service for ITU registered users.

Note: SNS Online will only be available 48 hours after registering for TIES.

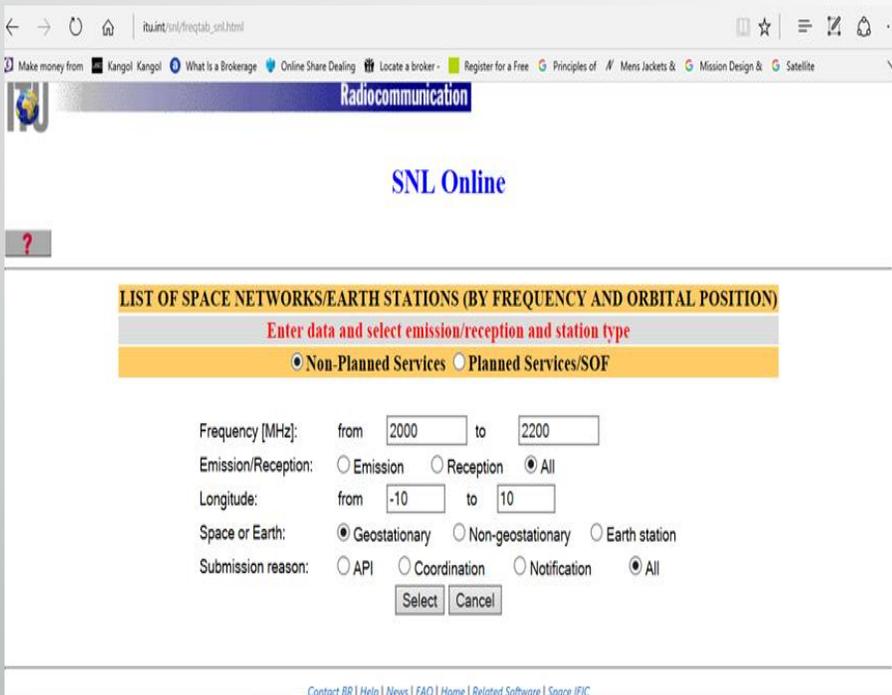

Try the [demo pages](#), and if you are not a TIES registered user, [subscribe](#) to the service.

As a subscriber, you can perform the following queries:

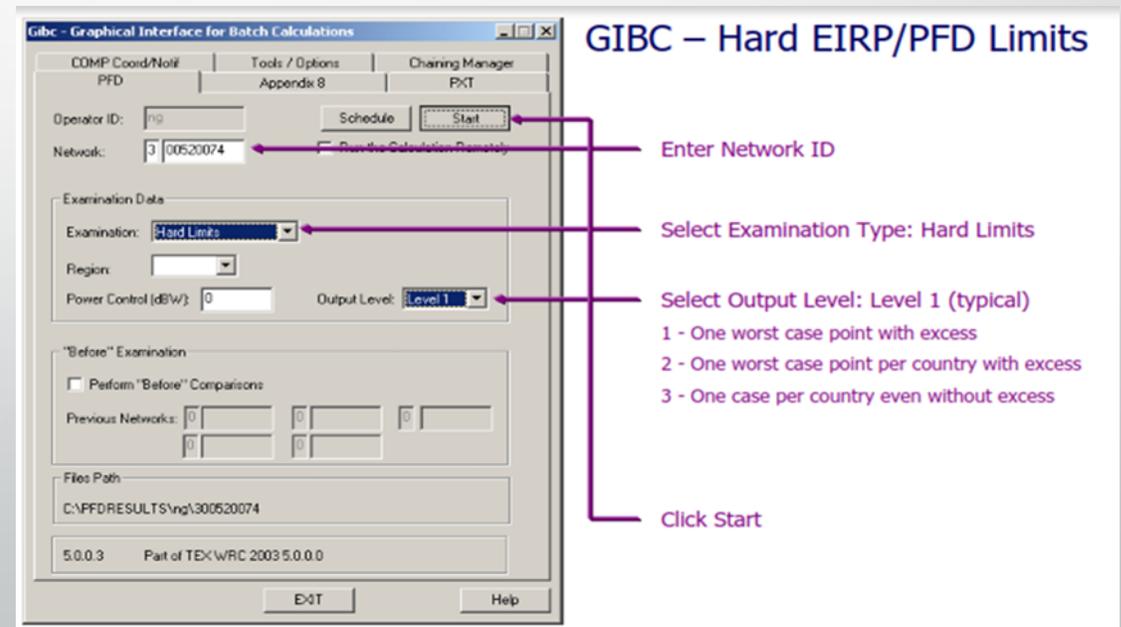

| Query System | Description |
|--|--|
| Query for non-planned bands | Query for non-planned bands |
| Query for planned bands | Query for planned bands |
| API Query (Regulatory deadlines) | API Query (Regulatory deadlines) |
| Resolution 49 Query (Due diligence filing) | Resolution 49 Query (Due diligence filing) |

ITU Recourses to manage the interference from satellite services into terrestrial services (cont.)

• **The Space Network List (SNL)** :It is an online services containing a list of basic information relating to existing or planned space stations, radio astronomy stations and earth stations.

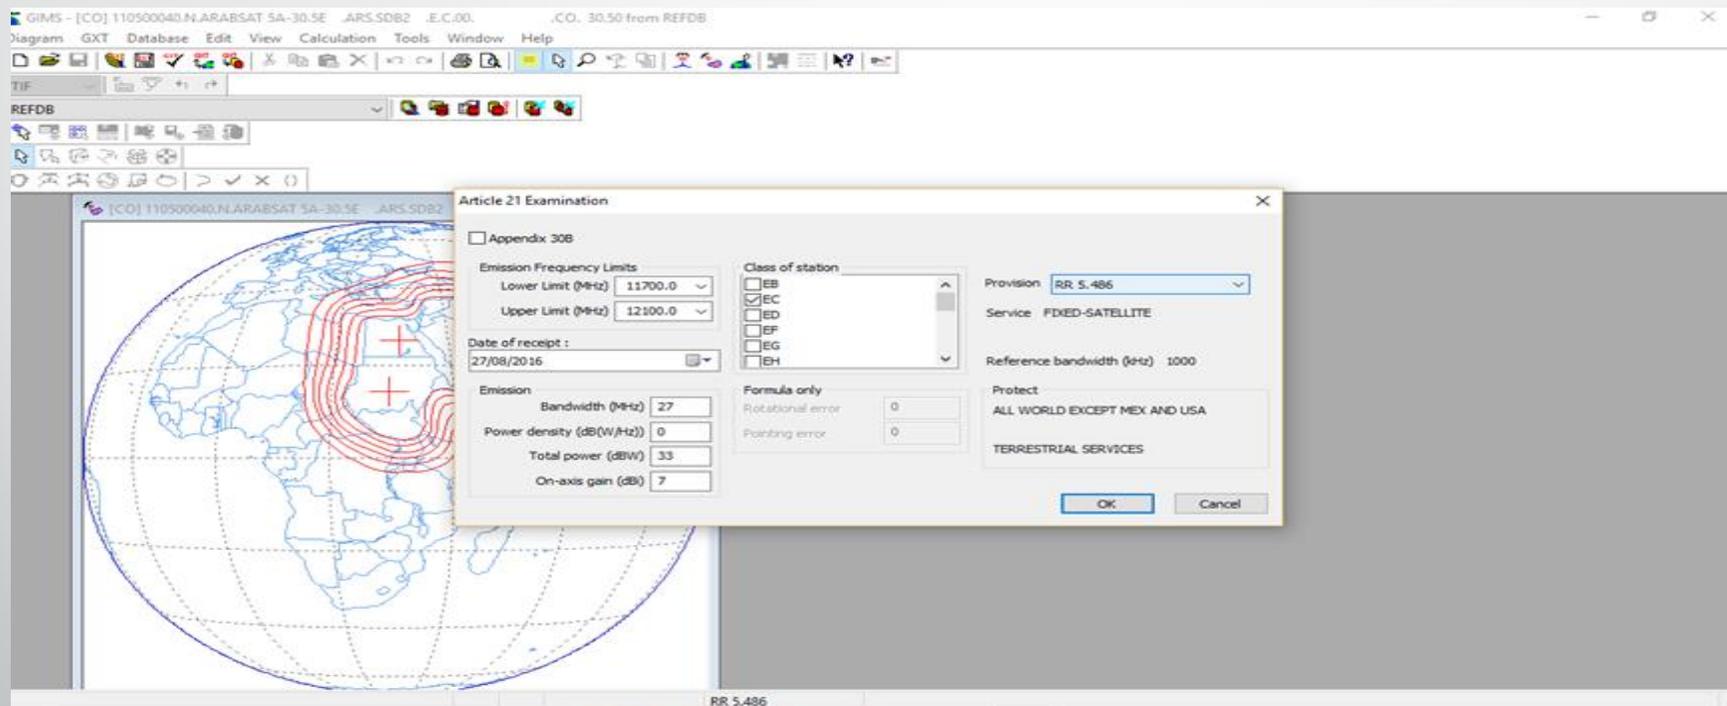

- **Graphical Interface for Batch Calculations (GIBC)** It is a software produced by ITU enables the user with the calculations on satellite networks to determine the coordination requirements on satellite networks, one of these calculations is a Power Flux Density (PFD) examination with respect to the PFD limits in Article 21 of radio regulation to protect the terrestrial services

ITU Recourses to manage the interference from satellite services into terrestrial services (cont.)

- **Graphical Interference Management System (GIMS)** It is a software published by ITU, is used for the capture and review of the graphical data relating to geostationary satellites. It also has the ability to perform PFD calculations according to article 21 of radio regulation to produce the list of countries where a pfd value is exceeded.

The Methodology of Interference Calculation

The analysis is based on calculating the interference power coming from each satellite to radio relay station, then compare the interference power with thermal noise power of the radio relay station and the impact of this interface on the performance of this station, So in order to calculate the interface power the below procedures have to be followed

1. Specify the Visible Satellites: To determine the limits of the visible geostationary (GEO) orbit from each earth position depending on the value of elevation angles, basically when value of elevation angle is positive it means the orbital position will be visible otherwise when elevation angle is negative it means this orbital position invisible, After determine the Visible GEO orbit, the searching for the satellites which introduce C-band services can be done on many websites which introduce information about the footprint for operating satellites,

The Methodology of Interference Calculation (cont.)

Satellites Footprint

to review the satellites which cover Iraq in C-band , there are many websites introduce information about the footprint for the satellites in GEO orbit , these websites like :

- <https://satellitecoverage.net/satellite-coverage-maps-footprint-files>
- <http://sattvinfo.net/beam.php?lang=en>
- <http://www.satbeams.com/footprints>

Satellite Coverage Maps (Footprints) and Satellite Tracking

Satellite Coverage Maps (Footprints) — Files
The footprint of a communications satellite is the ground area that its transponders offer coverage, and determines the satellite dish diameter required to receive each transponder's signal. There is usually a different map for each transponder (or group of transponders), as each may be aimed to cover different areas. Footprint maps usually show either the estimated minimum satellite dish diameter required or the signal strength in each area measured in dBW.

The Methodology of Interference Calculation (cont.)

- Using GIBS and GIMS software to exam the PFD value for the satellite networks if within ITU limitation or exceed:

The Methodology of Interference Calculation (cont.)

2. Determine the elevation angle(θ)

it is the angle between the horizontal and the line of sight from visible satellite to the earth position

$$\theta = \tan^{-1} \left(\frac{\cos G \cos(Lat-k)}{\sqrt{1-\cos^2(G)}} \cos^2(Lat) \right)$$

Where:

$$k = \frac{\text{Radius of earth (Re)}}{\text{Radius of orbit (Rs)}} = \frac{6378.137\text{Km}}{42164.17\text{Km}} = 0.1512$$

G= Difference between the Satellite Longitude and earth station Longitude

Lat= is the latitude of the radio-relay station.

3. Determine the slant range (S)

The Slant range is the line-of-sight distance between the satellite and radio-relay station, the formula of calculate the slant range:

$$S = Re \sqrt{\left(\frac{1}{k}\right)^2 - \cos^2(\theta)} - \sin(\theta)$$

The Methodology of Interference Calculation (cont.)

4. Calculate the Power flux density (Pfd)

the Power Flux Density, it is the amount of energy for unit area, the formula to calculate pfd value:

$$Pfd = \frac{eirp}{4\pi S^2} \text{ in W/m}^2$$

In decibel form:

$$Pfd = eirp - 10\log(4\pi) - 20\log(S) \text{ in dBW/m}^2$$

Where

S= slant range

eirp = the effective isotropic radiated power

eirp= Pt. Gt

Pt = the power of transmission

Gt = the antenna gain of transmission

$$\begin{aligned} Pfd &= eirp - 11 - 20\log(S) - 10\log(Bt/4\text{KHz}) && \text{in dBW/m}^2 \text{ per } 4\text{KHz} \\ Pfd &= eirp - 11 - 20\log(S) - 10\log(Bt/1\text{MHz}) && \text{in dBW/m}^2 \text{ per } 1\text{MKHz} \end{aligned}$$

5. Determine the power flux density limitation

According to ITU recommendation (ITU-R F.1107-1, 1994), the equation below is used to calculate the value of power flux density depending on the elevation angle value for each satellite:

$$F(\theta) = \begin{cases} -152 & \text{for } 0^\circ \leq \theta \leq 5^\circ \\ -152 + 0.5(\theta - 5) & \text{for } 5^\circ \leq \theta \leq 25^\circ \\ -142 & \text{for } 25^\circ \leq \theta \leq 90^\circ \end{cases}$$

The Methodology of Interference Calculation (cont.)

6. Determine the Azimuth Angle (Az)

The Azimuth angle is the angle from geographic north to the projection of satellite,

$$Az = \tan^{-1} \left(\tan \left(\frac{G}{\sin(lat)} \right) \right)$$

Where:

G= Difference between the Satellite Longitude and earth station Longitude

Lat= is the latitude of the radio-relay station.

Note: the actual azimuth is computed according to earth position from the equator, as for the countries that lay on north of equator like Iraq, the actual Azimuth angle (Az) should be,

$$Az = Az - 180$$

7. Determine the delta angle (Δ)

The delta angle is the angle between the incidence of the interfering satellite pfd level and the pointing direction of the radio-relay station:

$$\Delta = \cos^{-1} \cos \Theta \cos (Az - \delta)$$

Where

Θ = the elevation angle

Az= the azimuth angle

δ = is the pointing direction of the radio-relay station receiver

The Methodology of Interference Calculation (cont.)

8. Determined the antenna gain pattern

$G(\Delta)$

To calculate the antenna gain of the radio relay station in the direction of the interfering satellite depending on delta angle (Δ) between the incidence of the interfering satellite and the pointing direction of the radio-relay station, the ITU Recommendation (ITU-R F.699, 2006)

$$G(\Delta) = G_{max} - 2.5 \times 10^{-3} \left(\frac{D}{\lambda} \Delta\right)^2 \quad \text{for } 0^\circ < \Delta < \Delta_m$$

$$G(\Delta) = G_1 \quad \text{for } \Delta_m \leq \Delta < 100 \frac{\lambda}{D}$$

$$G(\Delta) = 52 - 10 \log \frac{D}{\lambda} - 25 \log \Delta \quad \text{for } 100 \frac{\lambda}{D} \leq \Delta < 48^\circ$$

$$G(\Delta) = 10 - 10 \log \frac{D}{\lambda} \quad \text{for } 48^\circ \leq \Delta \leq 180^\circ$$

Where:

$G(\Delta)$ = gain relative to isotropic antenna

G_{max} : the gain of main lobe in (dBi)

Δ : angle off-axis (degrees)

D : antenna diameter }
 λ : wavelength } expressed in the same units

G_1 : first side-lobe gain = $2 + 15 \log \frac{D}{\lambda}$

$\Delta_m = 20\lambda/D (G_{max} - G_1) \frac{1}{2}$

$G_{max} = 20 \log (D/\lambda) + 7.7$

9. Calculate the interference Power According to ITU recommendation (ITU-R F.1107-1, 1994), The interference power received at the radio-relay station as shown in below formula:

$$I = f(\theta) * g(\Delta) * \lambda^2 / 4\pi L$$

where:

I = interference power

$$f(\theta) = 10F(\theta)/10$$

$$g(\Delta) = 10G(\Delta)/10$$

λ = carrier's wavelength

L = feeder loss

The Methodology of Interference Calculation (cont.)

10. Interferences Evaluation

According to ITU recommendation (ITU-R F.1170-2, 2011), the assessment of interference into radio relay system could be done by calculating the interference to noise ratio (I/N) for each station which equal the fractional degradation of performance (FDP) .

$$FDP = \frac{I}{N}$$

where:

I: the total interference from visible satellites

N: thermal noise power of radio relay station

$$N = KTB$$

(the result in watt)

In decibel form N will be:

$$N = 10\log(K) + 10\log(T) + 10\log(B)$$

(the result in dBW)

where:

k = 1.38×10^{-23} J/K (Boltzmann constant)

T = noise temperature, Kelvin

B = bandwidth (Hz).

The Methodology of Interference Calculation (cont.)

MATLAB Functions

To determine the Interference power for each C-band satellite toward Iraqi territory, below the Matlab functions to determine the visible orbit, the elevation angle, slant range, power flux density, the azimuth angle, delta angle, the power flux density limitation, the gain for the radio relay station antenna, finally to find the interference power.

- `function [E] = visible_satellites (Lat, Lon)`
- `function [E] = elevation_angle (Lat, Lon)`
- `function [S] = Slant_Range (E)`
- `function [PFD]= Power_flux_density (S)`
- `function [F] = pfd_limit (E)`
- `function [Az] = Azimuth_angle (Lat, Lon)`
- `function [delta] = differnce_angle(E,Az,T)`
- `function [G] = cal_gai (Delta)`
- `function [I] = Interfernce_cal (F,G)`

Interferences calculations for Baghdad

The Latitude =33.35°N, Longitude =44.41°E

- **Scenario 1-1:** When antenna of radio relay station pointing at direction of 100° from the south, within ITU limitation of pfd
- **Scenario 1-2:** When antenna of radio relay station pointing at direction of 100° from the south, with exceed pfd = -75 (dBW/m²)
- **Scenario 2-1:** When antenna of radio relay station pointing at direction of 200° from the south, within ITU limitation of pfd
- **Scenario 2-2:** When antenna of radio relay station pointing at direction of 200° from the south, with exceed pfd = -75 (dBW/m²)
- **Scenario 3-1:** When antenna of radio relay station pointing at direction of 300° from the south, within ITU limitation of pfd
- **Scenario 3-2:** When antenna of radio relay station pointing at direction of 300° from the south, with exceed pfd = -75 (dBW/m²)

Interferences calculations for Baghdad

The Results (within pfd limitation)

Scenario 1-1: When antenna of radio relay station pointing at direction of 100° form the south,

total interference power= $5.94E-16$ watt

the thermal noise power for typical radio relay station = $2.07E-13$ W

FDP = $I/N * 100\% = 0.028\% = -15.5$ dB

Scenario 2-1: When antenna of radio relay station pointing at direction of 200° form the south:

total interference power = $4.53E-17$ watt

the thermal noise power for typical radio relay station = $2.07E-13$ W

then FDP = $I/N * 100\% = 0.022\% = -16$ dB

Scenario 3-1: When antenna of radio relay station pointing at direction of 300° form the south:

total interference power = $4.57E-17$ watt

the thermal noise power for typical radio relay station = $2.07E-13$ W

FDP = $I/N * 100\% = 0.022\% = -16$ dB

Interferences calculations for Baghdad

The Results (pfd exceed the limitation)

Scenario 1-2: When antenna of radio relay station pointing at direction of 100° form the south,

total interference power = 3.273×10^{-9} (W)

the thermal noise power for typical radio relay station = 2.07×10^{-13}

FDP = $I/N * 100\% = 1581160 \times 10^6 \% = 62$ dB

Scenario 3-2: When antenna of radio relay station pointing at direction of 300° form the south:

total interference power = 3.367×10^{-10} (W)

the thermal noise power for typical radio relay station = 2.07×10^{-13}

then FDP = $I/N * 100\% = 162657 \% = 52$ dB

Scenario 2-2: When antenna of radio relay station pointing at direction of 200° form the south:

total interference power = 3.09×10^{-10} (W)

the thermal noise power for typical radio relay station = 2.07×10^{-13}

then FDP = $I/N * 100\% = 149275 \% = 51.7$ dB

Drawing the Interference Map from C-band satellites cover Iraq territory

In order to draw the interference map for the emissions comes from visible C-band satellites that cover Iraq territory, that would be done by following the same procedures of calculating the interference power that used in calculating the total interference power in Baghdad for all Iraqi Provinces as their locations in longitude and latitude

| No. | The Name of Province | Latitude, longitude position |
|-----|----------------------|------------------------------|
| 1 | Misan | Lat=32.52°N, Lon=45.85° E |
| 2 | Al-Najaf | Lat=31.98° N, Lon =44.33° E |
| 3 | Thi Qar | Lat=31.03° N, Lon= 46.27 ° E |
| 4 | Al-Anbar | Lat=33.42° N, Lon= 43.28°E |
| 5 | Al-Sulaimaniyah | Lat=35.55° N, Lon = 45.43° E |
| 6 | Babil | Lat=32.48° N, Lon =44.42° E |
| 7 | Baghdad | Lat=33.35° N, Lon= 44.41° E |
| 8 | Diyala | Lat=34.02° N, Lon=45° E |
| 9 | Al-Basrah | Lat=30.50° N, Lon= 47.83° E |
| 10 | Arbil | Lat=36.18° N, Lon = 44.02° E |
| 11 | Karbala | Lat=32.60° N, Lon = 44.03° E |
| 12 | Kirkuk | Lat=35.46° N, Lon =44.43° E |
| 13 | Nineveh | Lat=36.35° N, Lon = 43.13° E |
| 14 | Salah al-Din | Lat=34.63° N, Lon = 43.60° E |
| 15 | Dohuk | Lat=36.87° N, Lon = 42.95° E |
| 16 | Wasit | Lat=32.5° N, Lon = 45.85° E |
| 17 | Al-Muthanna | Lat=31.3° N, Lon = 45.27° E |
| 18 | Al-Qadisiyah | Lat=31.95° N Lon=44.91°E |

Drawing the Interference Map from C-band satellites cover Iraq territory

The Total Interference power from C-band satellites in Iraqi Provinces, according three different scenarios

| No. | The Name of Province | I/N *100% Scenario A | I/N *100% Scenario B | I/N *100% Scenario C |
|-----|----------------------|-------------------------|-------------------------|-------------------------|
| 1 | Misan | 0.0216 % | 0.0297 % | 724 % |
| 2 | Al-Najaf | 0.0219 % | 0.0299 % | 714 % |
| 3 | Thi Qar | 0.0217 % | 0.0289 % | 695 % |
| 4 | Al-Anbar | 0.0218 % | 0.0308 % | 744 % |
| 5 | Al-Sulaimaniyah | 0.0213 % | 0.0314 % | 782 % |
| 6 | Babil | 0.0218 % | 0.0301 % | 724 % |
| 7 | Baghdad | 0.0217 % | 0.0305 % | 734 % |
| 8 | Diyala | 0.0215 % | 0.0306 % | 753 % |
| 9 | Al-Basrah | 0.0217 % | 0.0285 % | 685 % |
| 10 | Arbil | 0.0214 % | 0.0323 % | 797 % |
| 11 | Karbala | 0.0218 % | 0.0302 % | 729 % |
| 12 | Kirkuk | 0.0215 % | 0.0317 % | 782 % |
| 13 | Nineveh | 0.0214 % | 0.0325 % | 806 % |
| 14 | Salah al-Din | 0.0216 % | 0.0314 % | 768 % |
| 15 | Dohuk | 0.0385 % | 0.0121 % | 816 % |
| 16 | Wasit | 0.0216 % | 0.0297 % | 719 % |
| 17 | Al-Muthanna | 0.0219% | 0.0294 % | 705 % |
| 18 | Al-Qadisiyah | 0.0218 % | 0.0298 % | 714 % |

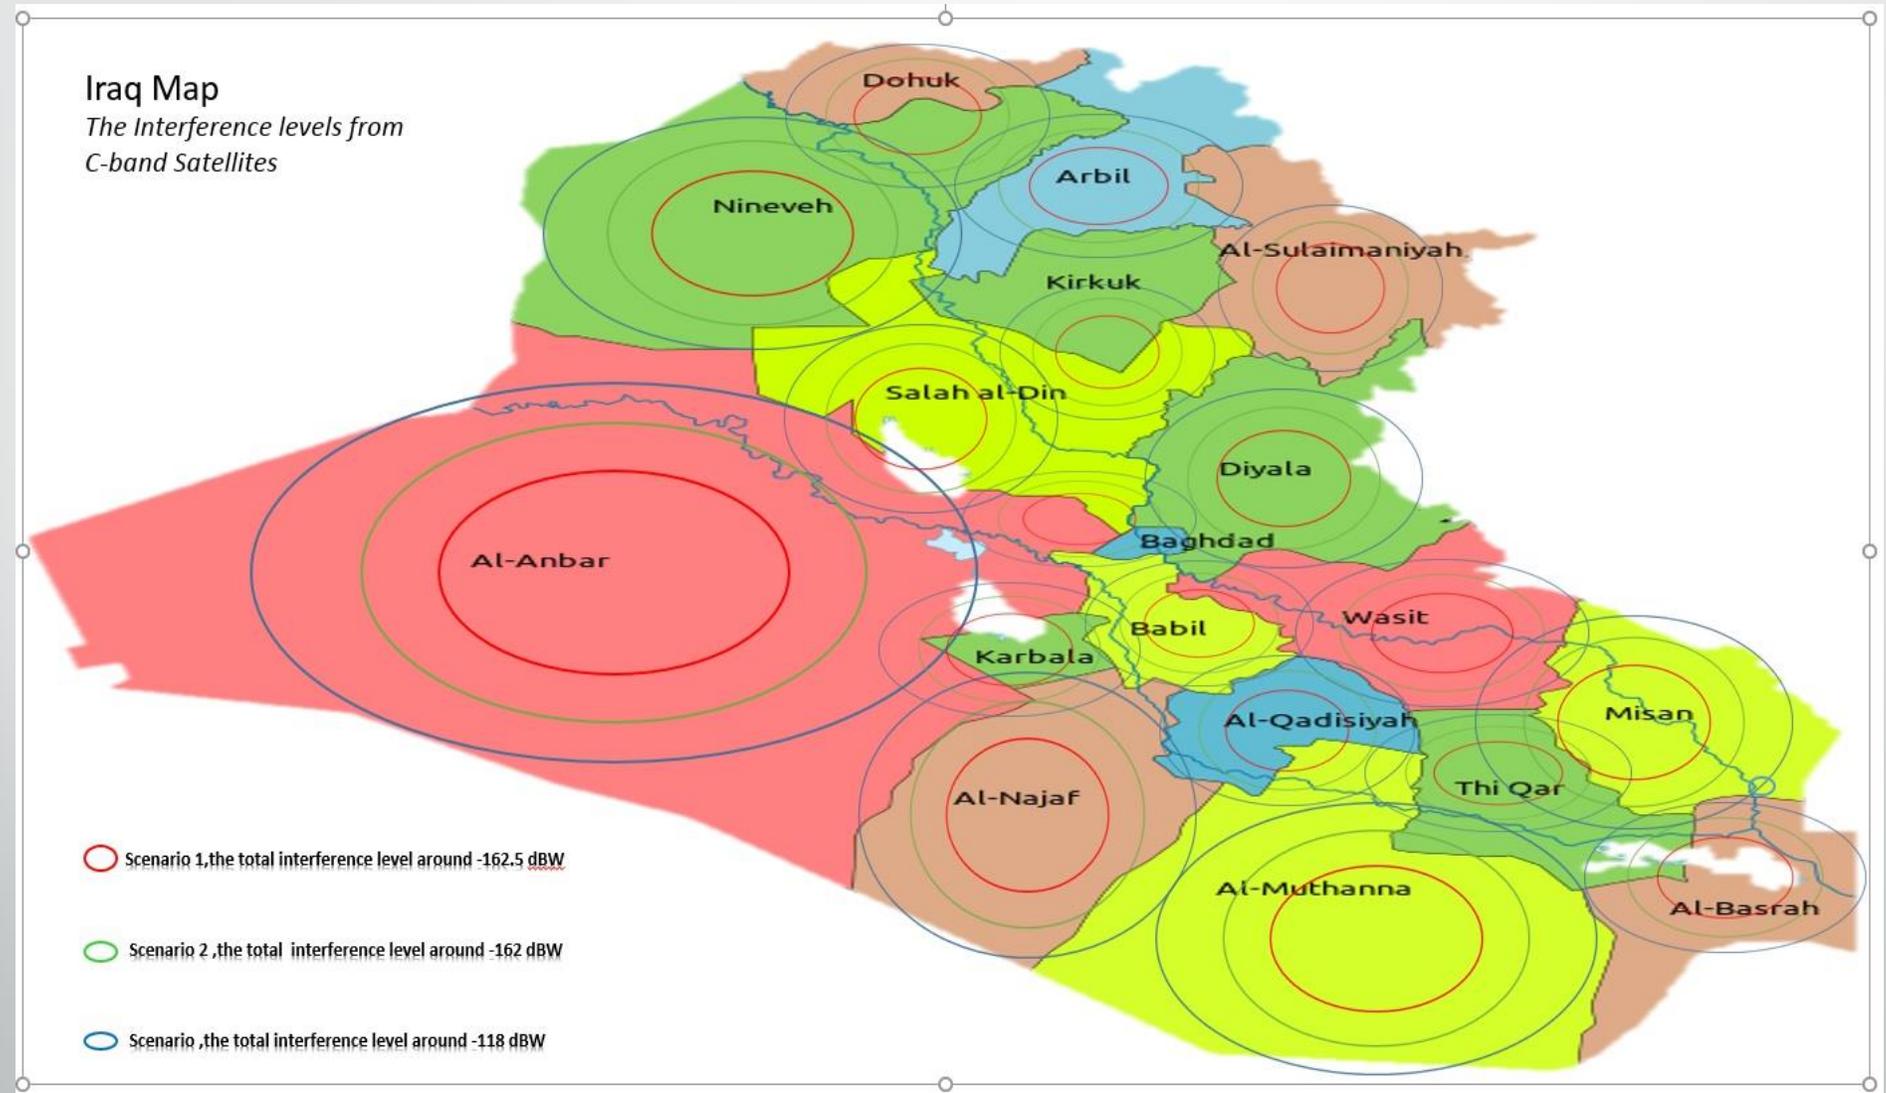

Scenario A: the total interference power from C-band satellites cover Iraq territory within ITU limitation pfd values, with terrestrial antenna azimuth equal 25°.

Scenario B: the total interference power from C-band satellites cover Iraq territory within ITU limitation pfd values, with terrestrial antenna azimuth equal 225°

Scenario C: the total interference power from C-band satellites cover Iraq territory within exceed pfd values (pfd =-100 dBW/m²), and terrestrial antenna azimuth equal 225°.

Interference Map from C-band satellites cover Iraq territory

The Interference Levels Map for Iraq (C-band)

The Conclusion

- the total interference power within the ITU limitation for pfd it could be considered as preassemble interference where the fractional degradation of performance for typical radio relay station is around 0.03%,
- According to ITU Recommendation (ITU-R F.758, 2015), the preassemble percentage of fractional degradation of performance should not exceed 10% for analogue radio relay station and not exceed 25% for digital radio relay station.
- when the pfd value is assumed to exceed in scenario 3 for Baghdad to -75 dBW/m^2 and to -100 dBW/m^2 for scenario C for all the Iraqi provinces, the percentage of fractional degradation of performance increase to very huge values for scenario 1-2 reached to $1.58 \times 10^6 \%$ when the azimuth of the radio relay antenna equal to 100° and for scenario C reached to 800% for Dohuk city, these high values are a great concern for panic
- Therefore should not accept to exceed the power flux density for the satellite more than the ITU limitations, Even the ITU allowed the satellite to operator and to exceed these limitation if the affected country accept, of course before accepting to exceed these limitation the interference should be analysed in order to decide if it is acceptable or not.
- It should be noted that the ITU limitation of pfd values in the band between (3400 to 5216 MHz) depending on considering the reference bandwidth is 4 KHz, of course this bandwidth is applicable for voice channel for analogue systems, but practically the services in this band may be not used just for voice service, especially with new trend of the communication which are depending on data services so the reference bandwidth of 4 KHz, is not applicable for all services.

Thanks
